## ISSA Symposium Securities Services Industry: Disrupted?

**AUTOMATION & ROBOTICS** 

ZURICH | 24 MAY

### Your presenters today

Matthias Voelkel Partner

Matthias\_Voelkel@mckinsey.com

### Vincent Van Lierde Partner

Vincent\_Van\_Lierde@mckinsey.com

# Topics of today's discussion

Perspective on the securities services industry Automation & Robotics – what are we talking about? Automation & Robotics in securities services

## Securities services industry has been growing at low-single digit growth rates since 2010

SOURCE: McKinsey

McKinsey & Company 4

### Constant margin pressure impacts the securities services industry

1 Includes local and global custody

### Automation & Robotics as structural lever to respond to industry trends

#### Number and diversity of securities

Higher number of securities in the market observed in recent years resulting in more work for the securities services players (e.g., growth to ~\$660bn in smart beta ETF AuM (~\$160bn net inflows in 2017))

#### Regulatory requirements

- Increasing regulatory requirements leading to higher number and more complex reports
- Higher number of message flows

Structural usage of **Automation & Robotics at scale** as compensation to industry trends

Increasing complexity, but not necessarily more revenue

Focus of this document

# Topics of today's discussion

Perspective on the securities services industry Automation & Robotics – what are we talking about? Automation & Robotics in securities services

# Automation & Robotics progressively replace or complement traditional efficiency levers like BPO and process redesign

Detailed on next pages

## Five Automation & Robotics technologies can be employed for large scale transformation of processes

process automation

Automate routine tasks through existing user interfaces (e.g., data extraction and cleaning) 2 Smart workflows

Integrate tasks performed by groups of humans and machines (e.g., month end processes) 3 Machine learning

Identify patterns in data through supervised and unsupervised learning (e.g., decision algorithms) 4 language processing

Create seamless interactions between humans and technology (e.g., data-tostory translation) 5 Cognitive agents

Build a virtual workforce capable of supporting employees and customers (e.g., employee service centers) Example robotics process automation (RPA): Mimicking user behavior and automating repetitive tasks with very limited development effort

Business user records workflow on his screen

Team creates process flow, which can be customized afterwards

Celaton

Software executes recorded workflow as required on dedicated workstation

Example natural language processing (NLP): Helping to improve efficiency, engagement, compliance and innovation

Increase Operational Efficiency by automating manual tasks

- Focus on higher-value tasks
- Tailored information at scale
- Deliver the most interesting and important information

Enhance Engagement at Scale by writing custom content

- Personalized narratives for your audience to increase loyalty
- Unlimited reach
- Power conversational interfaces and bots

Achieve Regulatory Compliance by generating compliance reports

- Automate writing for accuracy and time savings
- Traceable back to the record of system
- Narratives automatically update as data changes

Example cognitive agents: Cognitive agent Amelia can play the role of any customer service agent and when she does not know what to answers, she involves a human colleague and learns by listening

# Topics of today's discussion

Perspective on the securities services industry Automation & Robotics – what are we talking about? Automation & Robotics in securities services

### Applying Automation & Robotics in securities services – examples

		<b>~~</b>			
	Robotic process automation	Smart workflows	Machine learning	Natural language processing	Cognitive agents
Benefits	<ul> <li>Efficiency gains</li> <li>Quality improvement</li> <li>Lead time reduction</li> </ul>	<ul> <li>Efficiency gains</li> <li>Flexibility and agility</li> <li>Lead time reduction</li> </ul>	<ul> <li>Analytics driving new service offering/ pricing</li> <li>Cost mgmt.</li> </ul>	<ul> <li>Engagement at scale by driving custom content</li> <li>Achieve Regulatory Compliance</li> </ul>	<ul> <li>Client satisfaction</li> <li>Efficiency gains</li> <li>Development of new services</li> </ul>
Examples	<ul> <li>Automated reconciliation</li> <li>Automated first level of investigation</li> <li>Corporate action information processing</li> </ul>	<ul> <li>Investigation case handling</li> <li>Project team work allocation and follow-up</li> </ul>	<ul> <li>Advanced analytics applied to client data to drive pricing on client queries</li> </ul>	<ul> <li>Personalized narratives</li> <li>Unlimited reach</li> <li>Power chat interfaces and bots</li> <li>Very traceable</li> <li>Automatic updates as data changes</li> </ul>	<ul> <li>First and second level information handling on client services teams</li> </ul>

# The long tail of Automation & Robotics potential – Robotization can be a game changer as it enables automation support for resources focusing on what is not STP

The complexity of securities services organizations requires a specific approach to Automation & Robotics to achieve full impact of automation

## The big picture: How can the operating model of an advanced securities services player look like – leveraging Automation & Robotics at scale

Channels (e.g., dealers, brokers)		<ul> <li>Cognitive agents with specifically designed products that enable high share of self-service and automation</li> <li>Natural language processing tools that automates repeatable interactions with dealers and brokers</li> </ul>			
Product development, marketing, sales		<ul> <li>Machine learning used across all channels (e.g., product configuration/engines, social media analytics, channel productivity analytics)</li> </ul>			
Operations	Custodial services	<ul> <li>Extensive use of deep learning and AI analytics platforms for transaction management and trade</li> </ul>			
	Trade processing	<ul><li>processing</li><li>Cognitive agents to drive high levels of self-service</li></ul>			
	Account Admin and shareholder service	and automation, remaining with significantly automa processes			
ΙТ	IT security	<ul> <li>High level of standard software and cloud components</li> <li>Strong IT-demand and management function in-</li> </ul>			
	Applications	<b>house</b> , with IT build outsourced, in particular in non- differentiating areas			
	Infrastructure	<ul> <li>Significant automation of development and delivery functions</li> </ul>			
Others (Investment, Finance, HR)	Finance and HR	<ul> <li>Automation of 70%+ of tasks; 75% of all remaining FTEs engaged in analytical and value added tasks</li> <li>Machine learning for legal discovery and investments</li> <li>Preparation of Investor communications and MD&amp;A</li> </ul>			
	Procurement				
	Investments	<ul> <li>leveraging NLP (Figures to Prose)</li> <li>100% electronic communication, in- and externally</li> </ul>			
		<ul> <li>Performance tracking for effective demand management</li> </ul>
